[1.0 / RE1 / QG1]

CLINA7269 11/15

INTERPRETIVE CONSIDERATIONS

MCMII-IV reports are normed on patients who were in the early phases of assessment or psychotherapy for emotional discomfort or social difficulties. Respondents who do not fit this normative population or who have inappropriately taken the MCMII-IV for nonclinical purposes may have inaccurate reports. The MCMII-IV report cannot be considered definitive. It should be evaluated in conjunction with additional clinical data. The report should be evaluated by a mental health clinician trained in the use of psychological tests.

The patient is a 33-year-old single white male with a high school diploma or equivalent. He is currently being seen as an outpatient, and he reports that he has recently experienced a problem that involves his job or school. These self-reported difficulties, which have occurred for an unspecified period of time, may take the form of a clinical syndrome disorder.

No adjustments were made to the BR scores of this individual to account for any undesirable response tendencies.

The response style of this patient showed no unusual test-taking attitude that would distort MCMII-IV results.
